

CHECK LIST

(Gazi Kağan Soysal - 2210356050)

- 1)** I know that if a string is entered where a number is required, an incorrect command must be given (regardless of other conditions). However, although it says "hello" for color code in the "SetColorCode" command in the example output1, instead of giving a command error, the error is given as "this device is not a color lamp". I also wrote my code in accordance with the output. There may be a difference for that part.
- 2)** The first command is requested to be "SetInitialTime". But I wasn't sure if this is the first successful command or just any first command. In other words, if an incorrect command is entered and then a valid set initial time command is entered, I was not sure if we print an error message for the first command and then continue the program in its normal flow. So, even if the first command is wrong, "the first command should be set initial time, the program terminates." I gave an error.
